QwikStrips

The Industry leading Qwik Strips are an interproximal solution for removing cement from in between teeth and also for creating the precise spacing needed (IPR) for minor tooth movement.

When needed, QwikStrips superfine strips can also be used for simply smoothing any interproximal restoration, or for relieving the friction (heavy contact) prior to seating crowns, veneers, inlays or onlays. Check the contact, adjust with the Qwik Strip™ superfine strip, and then seat the restoration. It's that easy!

Visit our website to find out more.
